

The Warmest September on Record – in Oldbury, Tewkesbury?

Peter has digitally recorded 3 pm temperatures since 2011.

In **The Oldbury**, the average temperature for September has been **60.1F [15.6°C]** while **September 2023** the average temperature was **63.73F [17.6°C]** or **6% higher**. Interestingly the **6% higher at 7 a.m.** . The highest previous **September** temperatures were in **2021** with **6% at 7 am** and **5% at 3 pm**. **June 2023** the increase was **7% and 6% - and 4% in March** at 7 a.m.

In 2022 above average temperatures were recorded in **February - the biggest of 9% at 7 a.m., July [pm]** and **August**. These months were followed by a warm **October and November – for 2023?**

In **2021 September, November and December** had above average temperatures – with the highest differential of **18-19% in both times in November [followed by December]**.

I have only been comparing the monthly temperature with the average since 2017 when **February, March, June and October** had superior, but lower, monthly temperatures.

Is this food-for-thought prompted by the BBC?

I am not a mathematician/statistician and, if you are such a member who would like to check my figures, that would be appreciated.
